Conjecture of Iterative Structure in Planar

$\mathcal{N} = 4$ SYM

[Catani; Sterman, Tejada-Yeomans; Anastasiou, Bern, Dixon, Kosower; Bern, Dixon, Smirnov]

BDS Ansatz

$$\left(\frac{A_n^{(L)}}{A_n^{\text{tree}}} \right) = \sum_{l=0}^{L-1} \text{Div}_n^{(L-l)} \left(\frac{A_n^{(l)}}{A_n^{\text{tree}}} \right) + F_n^{(l)}$$

Formula based on soft & collinear limits.

Finite discrepancies begin at 6 gluons, 2-loop order.

What is the correct version?

Super amplitudes

Ruth Britto

Structure

Insights + Tools

Recent results

Outlook

Is $\mathcal{N} = 8$ supergravity finite?

Is gravity a double copy of gauge theory?

Possible: UV behavior is the same for $\mathcal{N} = 8$ supergravity and $\mathcal{N} = 4$ SYM, so finite in 4 dimensions.

e.g. power counting of the 2-loop 4-point amplitude is the same.

$N = 4$ SYM and $N = 8$ supergravity:

$$D_c = 4 + \frac{6}{L} \quad L = 2, 3, 4$$

True through 4 loops. 5 loops underway.

Feynman Rules

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

Feynman diagrams don't respect symmetries

Feynman diagrams are both numerous and tedious.

In the end, one finds **many cancellations** ending with a **gauge-invariant** result.

Symmetry offers clues for improvement. Amplitudes have **remarkable structure!**

Understanding the **simplicity** of gauge theory amplitudes leads to new, efficient techniques for calculation.

Conversely: the challenge of **difficult calculations** triggers discovery of shortcuts.

The no-triangle property for maximal supergravity

[Bern, Dixon, Perelstein, Rozowsky; Bern, Bjerrum-Bohr, Dunbar, Ita, Perkins, Risager; Bjerrum-Bohr, Vanhove]

Cancellations within the supermultiplet loop for $\mathcal{N} = 4$ SYM and $\mathcal{N} = 8$ supergravity eliminate triangle and bubble subgraphs.

Thus: softer divergences.

Supergravity cancellations are even stronger than those implied by no-triangle.

Gravity amplitudes: KLT relations

- Simple, despite infinity of vertices and no color ordering
- Kawai, Lewellen, Tye (KLT) expressed closed string amplitudes as sums of products of open string amplitudes (left and right moving modes).
- The field theory limit relates graviton and gauge field amplitudes.

[Berends, Giele, Kuijf; Bern, Dixon, Perelstein, Rozowsky]

- Nicer versions found via recursion relations

[Bern, Carrasco, Forde, Ita, Johansson; Elvang, Freedman]

$$A^{\text{grav}}(1^-, 2^-, 3^+, \dots, n^+) = \sum_{\mathcal{P}(i_3, \dots, i_n)} s_{1i_n} \left(\prod_{s=4}^{n-1} \beta_s \right) A^{\text{YM}}(1^-, 2^-, i_3^+, \dots, i_n^+)^2$$

$$\beta_s \equiv -\frac{\langle i_s, i_{s+1} \rangle}{\langle 2, i_{s+1} \rangle} \langle 2 | i_3 + \dots + i_{s-1} | i_s \rangle.$$

Clever coordinates

- Spinors and superfields $p = \lambda\tilde{\lambda}; \eta$

$$p_{a\dot{a}} = \sigma_{a\dot{a}}^{\mu} p_{\mu} \quad a, \dot{a} = 1, 2$$

Massless case:

$$0 = p^2 = \det(p_{a\dot{a}}) \implies p_{a\dot{a}} = \lambda_a \tilde{\lambda}_{\dot{a}}.$$

Lorentz-invariant spinor products:

$$\langle \lambda \lambda' \rangle \equiv \epsilon_{ab} \lambda^a \lambda'^b$$

$$[\tilde{\lambda} \tilde{\lambda}'] \equiv \epsilon_{\dot{a}\dot{b}} \tilde{\lambda}^{\dot{a}} \tilde{\lambda}'^{\dot{b}}$$

$$A(1^+, \dots, i^-, \dots, j^-, \dots, n^+) = \frac{\langle i j \rangle^4 \delta^{(4)}(\sum p_i)}{\langle 1 2 \rangle \langle 2 3 \rangle \dots \langle n-1 n \rangle \langle n 1 \rangle}$$

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

Clever coordinates

- Spinors and superfields $p = \lambda\tilde{\lambda}; \eta$

$$A_n^{\text{MHV}} = \frac{\delta^{(4)}\left(\sum_i \lambda_i^a \tilde{\lambda}_i^{\dot{a}}\right) \delta^{(8)}\left(\sum_i \lambda_i^a \eta_i^A\right)}{\langle 1 2 \rangle \langle 2 3 \rangle \dots \langle n-1 n \rangle \langle n 1 \rangle}$$

Superamplitude has components corresponding to the **on-shell superfield**

$$\begin{aligned} \Phi = & G^+ + \eta^A \Gamma_A + \frac{1}{2!} \eta^A \eta^B S_{AB} + \frac{1}{3!} \eta^A \eta^B \eta^C \epsilon_{ABCD} \bar{\Gamma}^D \\ & + \frac{1}{4!} \eta^A \eta^B \eta^C \eta^D \epsilon_{ABCD} G^-. \end{aligned}$$

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

Clever coordinates

- Spinors and superfields $p = \lambda\tilde{\lambda}; \eta$

Spinors allow us to write **polarization vectors** too:

$$\epsilon_{a\dot{a}}^- = \frac{\lambda_a \tilde{\mu}_{\dot{a}}}{[\tilde{\lambda}, \tilde{\mu}]}, \quad \epsilon_{a\dot{a}}^+ = \frac{\tilde{\lambda}_a \mu_{\dot{a}}}{[\lambda, \mu]}.$$

Gravity:

$$\epsilon_{a\dot{a}, b\dot{b}}^- = \epsilon_{a\dot{a}}^- \epsilon_{b\dot{b}}^-, \quad \epsilon_{a\dot{a}, b\dot{b}}^+ = \epsilon_{a\dot{a}}^+ \epsilon_{b\dot{b}}^+$$

Therefore we specify **helicity** states.

[Berends, Chang, Kleiss, De Causmaecker, Gastmans, Gunion, Kunszt, Stirling, Troost, Wu, Xu, Zhang]

- Momentum twistors $\mu + x \cdot \lambda = 0$

$$R_{t,rs} = \frac{\delta^{0|4} (\chi_t \epsilon(r-1, r, s-1, s) + 4 \text{ cyclic permutations})}{\epsilon(t, r-1, r, s-1) \epsilon(r-1, r, s-1, s) \epsilon(r, s-1, s, t) \epsilon(s-1, s, t, r-1) \epsilon(s, t, r-1, r)}.$$

Implement **momentum conservation** and **on-shell conditions** simultaneously. [Hodges]

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

On-shell techniques

- CSW/MHV rules

[Cachazo, Svrček, Witten]

MHV amplitudes are vertices of new diagrams.

Motivated by localization of MHV amplitudes on lines in twistor space = points in Minkowski space.

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

On-shell techniques

- CSW/MHV rules
- BCFW recursion relations [RB, Cachazo, Feng, Witten]

Residue theorem on a momentum-shifted, on-shell amplitude:

$$p_i(z) = p_i + zq; \quad p_j(z) = p_j - zq.$$

If $\lim_{z \rightarrow \infty} A(z) = 0$, then

$$0 = A(0) + \sum_{\text{poles } z_\pi \text{ of } A(z)} \text{Res} \left(\frac{A(z)}{z} \right)_{z=z_\pi}.$$
$$A(0) = \sum_{\pi} A_L(z_\pi) \frac{i}{P_R^2 - M^2} A_R(z_\pi).$$

Compact expressions.

Stronger boundary behavior \rightarrow “bonus” relations.

[Arkani-Hamed, Kaplan; Spradlin, Volovich; Elvang, Freedman; Badger, Henn; Feng, Huang, Jia]

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

On-shell techniques

- CSW/MHV rules
- BCFW recursion relations
- **Unitarity** cuts for loop amplitudes

[Bern, Dixon, Dunbar, Kosower]

$$\Delta A^{1\text{-loop}} = \sum_i c_i \Delta I_i$$

1-loop amplitudes are **cut-constructible**.

Supersymmetric amplitudes are **4d** cut-constructible.

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

On-shell techniques

- CSW/MHV rules
- BCFW recursion relations
- **Unitarity** cuts for loop amplitudes
- **Generalized** unitarity cuts with **complex** momenta

[RB, Cachazo, Feng]

Solves $4d \mathcal{N} = 4$ SYM and $\mathcal{N} = 8$ supergravity at 1-loop, given tree amplitudes and master integrals.

Similar “maximal” cuts for more loops, but less clean.

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

On-shell techniques

- CSW/MHV rules
- BCFW recursion relations
- **Unitarity** cuts for loop amplitudes
- **Generalized** unitarity cuts with **complex** momenta
- **OPP** algorithm

[Ossola, Papadopoulos, Pittau]

Numerical 1-loop amplitudes

Classification of integrands; coefficients from cuts.

Super amplitudes

Structure

Insights + Tools

Recent results

Outlook

Symmetries

- **Supersymmetry** as a tool
 - Tree-level QCD is effectively supersymmetric; can use on-shell superfields
 - Supersymmetry decomposition for QCD loop amplitudes

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

Symmetries

- Supersymmetry as a tool
- Dual (super)conformal symmetry in $\mathcal{N} = 4$ SYM

[Drummond, Henn, Korchemsky, Sokatchev; Berkovits, Maldacena; Brandhuber, Heslop, Travaglini]

- Motivated by duality: conformal invariance of Wilson loops.
- Combine superconformal and dual superconformal symmetries into Yangian $Y(PSU(2, 2|4))$
- Regulator of IR divergences breaks both symmetries. But the anomaly may be understood.
- Dual-conformal-invariant cross ratios = building blocks for amplitudes & integrands

$$\frac{x_{ij}^2 x_{kl}^2}{x_{ik}^2 x_{jl}^2}$$

Super amplitudes

Ruth Britto

Motivation

Structure

Insights + Tools

Recent results

Outlook

Integrands before integrals

Focus on **integrands** and integration separately.

- Integrands are uniquely defined in planar theories (region momenta)
- Constructible from recursion relations
- Yangian invariant
- Derive amplitude/Wilson loop duality, extended beyond MHV

[Arkani-Hamed, Bourjaily, Cachazo, Caron-Huot, Trnka; Boels; Adamo, Bullimore, Mason, Skinner]

Hope to improve integration independently, perhaps by motivic algebra (symbols).

Super amplitudes

Ruth Britto

Motivation

Structure

Outlook

Amplitudes as polytopes

Compact formulas are elements of a triangulation. [Hodges]

$$\begin{aligned}
 & \frac{[4|5 + 6|1]^3}{[34][23]\langle 56 \rangle \langle 61 \rangle [2|3 + 4|5] s_{234}} + \frac{[6|1 + 2|3]^3}{[61][12]\langle 34 \rangle \langle 45 \rangle [2|3 + 4|5] s_{612}} = \\
 & \frac{s_{123}^3}{[12][23]\langle 45 \rangle \langle 56 \rangle [1|2 + 3|4][3|4 + 5|6]} + \frac{\langle 12 \rangle^3 [45]^3}{\langle 16 \rangle [34][3|4 + 5|6][5|6 + 1|2] S_{612}} \\
 & + \frac{\langle 23 \rangle^3 [56]^3}{\langle 34 \rangle [16][1|2 + 3|4][5|6 + 1|2] S_{234}}
 \end{aligned}$$

Higher-loop integrands are polytopes in projective spaces;
dual to Wilson loops

To the integral: symbols for polylogarithms

- Discrepancy from BDS Ansatz discovered in general from Wilson loops

[Alday, Maldacena; Brandhuber, Heslop, Travaglini]

- First discrepancy at $R_6^{(2)}$; expression written down

[Bern, Dixon, Kosower, Roiban, Spradlin, Vergu, Volovich; Del Duca, Duhr, Smirnov]

- $R_6^{(2)}$ simplified dramatically with an ansatz suggested by “symbols” [Goncharov, Spradlin, Vergu, Volovich]

$$\log R \rightarrow R$$

$$\log R_1 \log R_2 \rightarrow R_1 \otimes R_2 + R_2 \otimes R_1$$

$$\text{Li}_2 R \rightarrow -(1 - R) \otimes R$$

$$\dots \otimes (R_a R_b) \otimes \dots = \dots \otimes R_a \otimes \dots + \dots \otimes R_b \otimes \dots$$

$$\dots \otimes (cR) \otimes \dots = \dots \otimes R \otimes \dots$$

Outlook

$\mathcal{N} < 4$ or massive SYM

On-shell superfield formalism is extended and allows for efficient recursion

- Compact tree amplitudes in $\mathcal{N} < 4$, and the origin of bubble integrals
- Massive amplitudes on the Coulomb branch of $\mathcal{N} = 4$ SYM
- Dual conformal generators constructed
- Also examples in (S)QCD, Abelian Higgs model, massive vector boson currents

[Elvang, Huang, Peng; Craig, Elvang, Kiermaier, Slatyer; Boels, Schwinn; Elvang, Freedman, Kiermaier; Boels, Isermann]

Recent results

Outlook

Supergravity

- SUSY and $E_{7(7)}$ constraints on counterterms for $\mathcal{N} = 8$ supergravity rule out divergences below 7 loops

[Beisert, Elvang, Freedman, Kiermaier, Morales, Stieberger]

- $\text{Grav} = \text{YM}^2$ in 1-loop, 4- or 5-pt amplitudes in $\mathcal{N} \geq 4$ supergravity

[Bern, Boucher-Veronneau, Johansson]

- $\mathcal{N} = 7$ recursion relation simplifies tree amplitudes; momentum twistors play a role

[Hodges]

Outlook

Triality in $\mathcal{N} = 4$ SYM

- Planar MHV **amplitudes** dual to **Wilson loops** on contour of null momenta. Wilson loops are easier to calculate.

[Alday, Maldacena; Brandhuber, Heslop, Travaglini]

- **Correlation function** of 1/2 BPS operators in the limit of lightlike separation, with pole singularities removed, and regularized, is the **Wilson loop** squared.

[Alday, Eden, Korchemsky, Maldacena, Sokatchev; Adamo, Bullimore, Mason, Skinner]

- Last link: lightlike separation limit of **correlation functions** gives **amplitudes**.
Loop corrections by Lagrangian insertions, then “dual infrared” dimensional regularization.

[Eden, Korchemsky, Sokatchev]

Outlook

Triality in $\mathcal{N} = 4$ SYM

- **amplitudes** \leftrightarrow **Wilson loops** fails beyond MHV;
amplitudes \leftrightarrow **correlators** is ok, through 6 points.

[Belitsky, Korchemsky, Sokatchev; Eden, Heslop, Korchemsky, Sokatchev]

- Detailed correspondence of **integrand**s, through 4 loops for 4 points
- Twistor space is the natural setting for the Wilson loops
- Duality from Wilson loops \rightarrow descent equations relating amplitudes of different orders

[Caron-Huot, He; Bullimore, Skinner]

ABJM amplitudes

Amplitudes of $\mathcal{N} = 6$ Chern-Simons matter theory [Aharony,

Bergman, Jafferis, Maldacena]

exhibit an $OSp(6|4)$ Yangian symmetry, [Bargheer, Loebbert, Meneghelli;

Gang, Huang, Koh, Lee, Lipstein]

and a corresponding Grassmannian integral description. [Lee]

Two-loop **confirmation** of amplitude/Wilson loop duality;
one-loop evidence for correlator/Wilson loop duality.

[Bianchi, Leoni, Mauri, Penati, Ratti, Santambrogio]

Two-loop correction = one-loop correction to $\mathcal{N} = 4$ SYM;
conjectured to all orders in dim. reg.

[Chen, Huang; Bianchi, Leoni, Mauri, Penati]

Outlook

Witten diagrams

- BCFW recursion relations in flat space have the physics of a hard particle blasting through a soft background at a *point*

[Arkani-Hamed, Kaplan]

- Generalize to AdS: integrate over interaction points

[Raju]

- Derive recursion relations in terms of 3-point “transition amplitudes”

[Raju]

- Diagrammatic recursion for CFT correlators

[Fitzpatrick, Kaplan, Penedones, Raju, Van Rees]

Outlook

String amplitudes

- Momentum kernel shown to factorize closed into open string amplitudes, give minimal basis in YM

[Bjerrum-Bohr, Damgaard, Sondergaard, Vanhove]

- String scattering in flat space: in high-energy limit, similar behavior as in AdS: minimal surfaces, gluing analog of KLT relations

[Caputa, Hirano]

- Pure spinor technology \rightarrow N -point string disk amplitudes in compact forms

[Mafra, Schlotterer, Stieberger]

- Three-point amplitudes with massive legs

[Boels]

Recent results

Outlook

Outlook

- Precision calculations for LHC, at NLO and looking towards NNLO
- $\mathcal{N} = 4$ SYM: all-order results, direct path to remainder function; Regge limit and form factors
- $\mathcal{N} = 8$ supergravity: divergent behavior does/does not match SYM at 5 loops; cleaner formulations
- CFT correlation functions from AdS amplitudes
- Understanding color/kinematics interplay
- Results in theories with mass, less supersymmetry
